Tensar asphalt geosynthetics

Efficiency Through Technology

FCL

Foster Contracting Limited

Serving the industry since 1911

FCL are backed technically by the world leaders in asphalt geosynthetic technology and are the recommended installers for a variety of asphalt reinforcement products.

Tensor asphalt geosynthetics

FCL are suppliers and installers of geosynthetics and composites for asphalt overlay. We use our own calibrated binder distributors to spray a bond coat of 160/220PEN (straight run) bitumen. The hot applied binder is compatible with all asphalts and requires NO BREAK TIME.

Mechanical installation with our specially designed applicator and fully qualified staff ensures a fast and crease free installation.

Once the reinforcement is placed on the binder it is stuck fast and can be immediately paved without the worry of the membrane lifting.

We began laying asphalt geosynthetics in 1993 with an applicator which we designed and built for the purpose. This design with subsequent minor improvements has become the industry norm for laying asphalt geosynthetics in the UK. FCL are the UK's longest established installers of asphalt geosynthetics.

Tensor asphalt reinforcement systems have been demonstrated to increase the service life of roads and thereby save money over the full life-cycle. Tensor systems can provide a significant reduction in construction costs over traditional methods.
